LAAI | EDUCATION EDITION

You don’t need 20 AI tools. You need a strategy.

For schools of architecture, building and engineering, master’s programmes and teaching teams: how to bring AI into teaching with clear rules, a few well-chosen tools and assessment that still measures learning.

INSIDE

5 building blocks, AI levels for assignments, a full example for a master’s programme and a template

CHECKED

October 2026 · Málaga

WHAT HAPPENS WITHOUT A PLAN

Students already use AI. The question is whether they learn with it.

Banning AI does not work, and letting each person decide alone does not either. The usual result: many tools, a different rule in every subject, and nobody teaching students how to check what AI gives them.

A 30-STUDENT MASTER'S PROGRAMME, BEFORE A STRATEGY FICTIONAL EXAMPLE

TYPE OF AI TOOL	DIFFERENT TOOLS	STUDENTS USING	ALLOWED?
Chat assistants	5	28	Nobody knows
Image generators for panels	4	17	Nobody knows
"Chat with your PDF" tools	2	12	Nobody knows
Translators and paraphrasers	3	15	Nobody knows
Note-takers and transcription	2	9	Nobody knows
Coding helpers for Grasshopper or Dynamo	2	4	Nobody knows
AI detectors, used by some teachers	1	–	Nobody knows
Total	**19**		

12 rules
one per teacher, so students never know what is allowed

Unclear
where student work and building data are uploaded

0
assignments that teach how to check AI output

AI detectors are not reliable evidence: they miss AI text and flag human text, especially from non-native writers. A clear policy works better than detection.

LEARNING FIRST, TOOLS LAST

An AI strategy for a programme fits on one page

It is a short agreement in the teaching team: what students should learn about AI, where it is allowed, encouraged or not allowed, which few tools you support, and how assessment still shows what each student can do.

01
Learning goals
Which AI skills graduates need, and which skills must stay their own.

02
Uses in teaching
Where AI helps students learn faster, and where it would replace the learning.

03
Rules
One shared policy, an AI level for each assignment, approved tools and data rules.

04
People
Training for teachers, one coordinator, and student representatives involved.

05
Review
A survey and a short meeting at the end of every semester.

> **The goal is not students who use many AI tools, but graduates who know when to use AI, how to check it, and when to trust their own judgement.**

Tool-first

- ☐ Each teacher allows or bans AI in their own way
- ☐ Students pay for their own tools, so access is unequal
- ☐ Assessment checks the final document only
- ☐ AI detectors replace conversations

Strategy-first

- ☐ One policy and an AI level on every assignment
- ☐ A few supported tools, available to every student
- ☐ Assessment looks at the process and an oral defence
- ☐ Checking AI output is taught as a skill

HOW MANY TOOLS A PROGRAMME NEEDS

Three layers, three or four tools

Teach a few tools well instead of many tools badly. Students who understand one assistant and one scripting workflow can learn any new tool later.

LAYER 1

One AI assistant for everyone

Ideally the university's own licence, so access is equal and data stays under its terms. For reading sources, writing and language.

Students and teachers

LAYER 2

AI inside the discipline's software

Writing small scripts for Rhino, Grasshopper, Revit or Dynamo with an AI coding assistant. This is a professional skill in itself.

Digital tools teacher

LAYER 3

Specialised tools: shown, not required

Demonstrated in class so students know what exists, without asking anyone to buy a subscription.

Guest sessions

What EU rules already say about AI in education

- ☐ **AI literacy:** since February 2025 the EU AI Act asks organisations that use AI to make sure their staff have enough AI knowledge. Training teachers is part of that.
- ☐ **Assessment is high-risk:** AI used to grade students, decide admissions or monitor exams is classed as high-risk, with strict duties. Keep grading decisions with people.
- ☐ **Personal data:** student work and names fall under GDPR. Use tools with an agreement from the university.

General information, not legal advice. Check current dates and guidance with your university's data protection and legal services.

HOW TO BUILD YOUR STRATEGY

Six steps, before the next semester

A teaching team can prepare a working AI strategy in a few meetings, ideally before the course starts, and improve it each semester.

01

Agree the learning goals

Which AI skills should a graduate have, and which skills must students show without AI? Write three or four lines in the teaching team.

TIP Start from your existing competences.

02

Ask how students really work

A short anonymous survey: which tools they use, for what, and where their hours go in a typical project.

TIP You will be surprised by the answers.

03

Give each assignment an AI level

From “without AI” to “AI as part of the method”. Students see the level in the brief and declare how they used AI.

TIP See the scale on page 8.

04

Choose the tools and the rules

One assistant everyone can access, one scripting workflow, and a one-page policy on data, declaration and assessment.

TIP Ask your data protection office early.

05

Train the teachers first

A half-day with their own subjects and assignments. Teachers who use AI themselves write better briefs and give better feedback.

TIP This also covers the AI literacy duty.

06

Review every semester

A student survey and a one-hour meeting with teachers and student representatives: keep, change or drop.

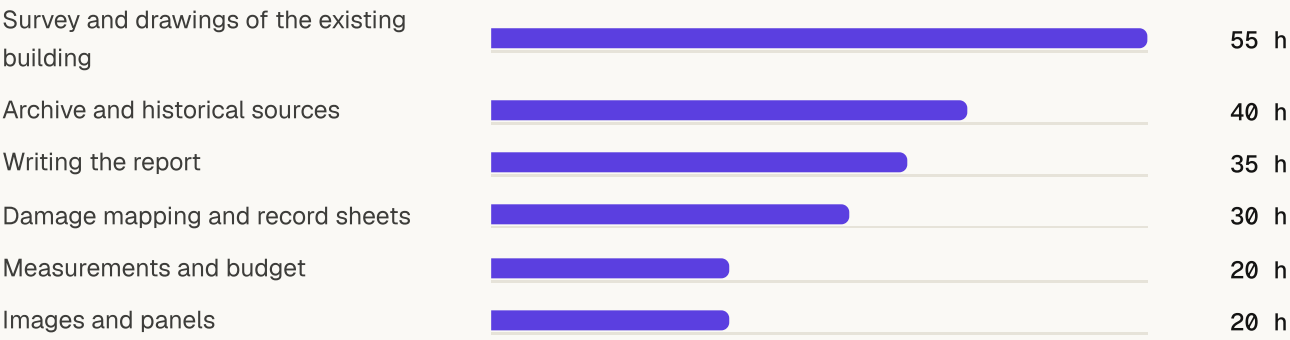

TIP AI changes fast; the strategy should too.

EXAMPLE STRATEGY FICTIONAL EXAMPLE

A master's in rehabilitation: 30 students, 19 AI tools, no shared rules

A one-year master's in architectural rehabilitation with 12 teachers. The students' main project is the full study of an existing historic building. An anonymous survey asked where their hours go.

MAIN PROJECT · HOURS PER STUDENT

200 hours per student, of which about 105 go to repetitive documentation: survey, record sheets and measurements.

WHERE AI HELPS LEARNING, AND WHERE IT WOULD REPLACE IT

TASK	HOW AI COULD HELP	RISK TO LEARNING	DECISION
Survey to drawings	Scripts clean and organise survey data	Low	ENCOURAGE
Damage record sheets	Templates filled from the model	Low	ENCOURAGE
Measurements	Quantities read from the model	Low	ENCOURAGE
Archive sources	Summaries and transcription of old texts	Medium	ALLOW, VERIFY
Report writing	Language and structure	Medium	ALLOW, DECLARE
Intervention criteria	Would replace the student's judgement	High	OWN WORK

MASTER'S IN REHABILITATION · AI STRATEGY 2026-27 FICTIONAL EXAMPLE

The strategy on one page

WHY	**Graduates who use AI with judgement: faster with documentation, critical with sources, and responsible with heritage.**
LEARNING GOALS	1. **Check AI output** against sources, the building and the regulations 2. **Build one small tool** with AI that automates a documentation task 3. **Defend intervention criteria** in their own words, without AI 4. **Declare** how AI was used in every assignment
TARGETS · ONE YEAR	1. **100% of assignments** show an AI level in the brief 2. **All 12 teachers** complete a half-day of AI training 3. **Documentation time** in the main project from 105 to 65 hours per student 4. **Students rate their confidence** in checking AI output at 4 out of 5 or higher
TOOLS	**The university's AI assistant** for everyone, **one AI coding assistant** in the digital tools workshop, and the software already taught (Rhino, Revit). Specialised tools are shown in guest sessions, never required.
RULES	An AI level on every brief, a short AI declaration with each submission, assessment of the process and an oral defence, no AI in grading decisions, and no AI detectors used as evidence.
PEOPLE	The programme coordinator owns the strategy, the digital tools teacher supports colleagues, and two student representatives join the review.
NOT THIS YEAR	AI-based grading, tools students must pay for, and banning AI across the whole programme.

ONE SCALE FOR THE WHOLE PROGRAMME FICTIONAL EXAMPLE

Every assignment has an AI level

One simple scale replaces twelve different rules. Teachers choose the level when they write the brief; students know exactly what is allowed.

LEVEL	NAME	WHAT IT MEANS
0	**Without AI**	The work shows what the student can do alone: exams, oral defences, intervention criteria.
1	**AI to prepare**	Ideas, planning, language and reading support. The content is the student's own.
2	**AI as an assistant**	AI may draft or summarise. The student declares it, checks every fact and keeps the prompts.
3	**AI as part of the method**	Using AI well is the skill being assessed, for example building a script with it.

THE LEVELS IN THE EXAMPLE PROGRAMME

SUBJECT	ASSIGNMENT	AI LEVEL
Historical and construction analysis	Documentary study of the building	LEVEL 1
Survey and graphic documentation	Model of the existing building	LEVEL 3
Pathology and diagnosis	Damage record sheets	LEVEL 2
Intervention criteria	Proposal and oral defence	LEVEL 0
Final master's project	Report with a section on methods and AI use	LEVEL 2

The AI declaration: three lines with each submission

Which tool I used · what I used it for · how I checked the result. Prompts go in an annex. A missing declaration is treated like a missing reference.

Inspired by the AI assessment scales that many universities now use; adapt the levels and wording to your own regulations.

ONE ACADEMIC YEAR FICTIONAL EXAMPLE

A roadmap that follows the academic calendar

BEFORE THE COURSE

Prepare

- ☐ Agree the policy and the AI scale
- ☐ Check data terms with the university
- ☐ Half-day training for teachers

SEMESTER 1

Start

- ☐ AI levels in every brief
- ☐ Guest session on AI and BIM
- ☐ Scripting workshop: one tool per student

SEMESTER 2

Apply

- ☐ Main project with the new tools
- ☐ Final project with a methods and AI section
- ☐ Student survey

END OF YEAR

Review

- ☐ Compare with the baseline
- ☐ Update the levels and tools
- ☐ Plan next year

WHAT GETS MEASURED

INDICATOR	BASELINE	TARGET	HOW
Assignments with an AI level	0%	**100%**	Course briefs
Teachers trained	2 / 12	**12 / 12**	Training register
Documentation hours per student	105 h	**65 h**	Survey
Confidence checking AI output (1–5)	2.4	**≥ 4**	Survey
AI tools students must pay for	Several	**0**	Course guide

```
Time given back to learning = (105 − 65) h × 30 students = 1,200 h a year
used for analysis, site visits and design
```

+40 h

per student for the parts of the project that need their judgement, and a documentation skill they will use at work.

Read these numbers as an example

The programme, survey results and targets are fictional. Your own figures come from step 2: asking your students how they work.

TEMPLATE · PRINT AND FILL IN

Your programme's AI strategy on one page

Fill it in with the teaching team in one meeting. If a line stays empty, that is your first task.

Why	What should AI change for our students, in one sentence?
Learning goals	3–4 AI skills, and the skills that stay without AI
How students work	Survey results: tools used and where the hours go
AI levels	Our scale, and the level of each main assignment
Supported tools	Layer 1, layer 2, and what we only demonstrate
Rules	Declaration, data, assessment, oral defence
People	Coordinator, support teacher, student representatives, training date
Not this year	What we deliberately leave out
Measure	Indicators, baseline and target
Review dates	End of each semester

NEXT STEP

Bring AI into your programme with practice, not theory

I'm Lavinia Lorena Jilavu, a BIM expert in Málaga. I helped bring AI into daily work at a modular timber company and built around 30 tools with it. For schools and universities I offer:

- ☐ **Guest sessions** on AI and BIM in real practice, in person or online.
- ☐ **Hands-on workshops** where each student builds a small tool with AI for Rhino, Grasshopper or Revit.
- ☐ **Training for teaching teams** using their own subjects and assignments.
- ☐ **Help writing your programme's AI strategy**, in Spanish, English or Italian.

Let's talk about your programme

A first conversation and a first session at no cost.
